WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

WEEK ENDING 18 DECEMBER 1943

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the charts on pages 3 and 4, the outbreak of influenza passed its peak among Army personnel during the week ending 18 December 1943 and the rate of admissions from colds, influenza, etc. was reported at 593 per thousand per year for that week as compared with a rate of 631 per thousand for the week ending 11 December 1943. All Service Commands with the exception of the Eighth and Ninth (both of which had previously shown the lowest rates of admission from colds, influenza, etc.) registered decreased morbidity from these causes.

Despite this decrease, however, admissions from influenza continued to run abnormally high, as is indicated by the fact that morbidity from colds and influenza for the week ending 18 December 1943 was about 20 percent higher than for the corresponding week of 1942, which had registered the highest rate of admissions from colds and influenza in 1942.

Morbidity from all forms of pneumonia continued at the rate of 20 per thousand per year, which is almost 25 percent lower than for the corresponding week of 1942.

As a result of the decrease in the admission rate from colds, influenza, etc. there were corresponding declines in morbidity from all causes and from all diseases combined for the week ending 18 December 1943. The all causes rate was reported at 1110 per thousand per year and the all diseases rate at 1042 per thousand, both being about 10 percent above the rates for the corresponding week in 1942. The admission rate from injury continued low at less than 80 per thousand.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

As mentioned above only the Eighth and Ninth Service Commands registered higher morbidity from colds, influenza, etc. for the week ending 18 December 1943. Sharp increases in morbidity from these causes were reported from the Eighth and Ninth Service Commands much later than from the other Service Commands. For the week ending 11 December 1943 the admission rates from colds, influenza, etc. in these Commands were both under 450 per thousand per year or below their high points reached in the early months of 1943, but during the week ending 18 December the morbidity from these causes increased to almost 500 per thousand in the Eighth Service Command (which was still below the high point reached in January 1943) and to over 575 per thousand in the Ninth Service Command (which was the highest rate reported in 1943).

In this connection it is noteworthy that the Fourth Service Command also recently experienced morbidity from colds, influenza, etc. no higher than it reported in January 1943. For the week ending 11 December the Fourth Service Command showed an admission rate from these causes of nearly 525 per thousand per year, which rate dropped to about 425 per thousand for the week ending 18 December 1943, the lowest rate currently reported from any Service Command.

The largest decreases in the admission rates from colds, influenza, etc. were reported by the Fifth, Sixth, and Third Service Commands and the Military District of Washington, all of which were among those reporting the highest morbidity during the week ending 11 December. Only the Second Service Command and the Military District of Washington have continued to show morbidity from these causes in excess of 1000 per thousand per year.

Because of their very high rates of admission from colds, influenza, etc. the Second and Seventh Service Commands and the Military District of Washington all reported morbidity from all causes in excess of 1500 per thousand per year. The Fourth and Eighth Service Commands were the only ones to show morbidity from all causes under 1000 per thousand.

Five of the six stations showing the highest morbidity from colds, influenza, etc. during the week ending 18 December were not among those reporting the highest morbidity from these causes for the preceding week.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity increased slightly during the week to nearly 358,000 on 18 December 1943, while the beds occupied decreased to about 198,000. The number of "available vacant" beds increased to nearly 90,000. There were 58 stations with a bed capacity of more than 30,000 which had no "available vacant" beds; among them were 12 general hospitals with a bed capacity of 17,000 beds.

On 18 December there were 1680 cases of malaria remaining under treatment, all but 16 of which were presumably acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was reported at 15,307.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 27 NOV. 1943

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA

The data of this supplementary report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 27 November 1943 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Reports.

This supplementary report includes morbidity data for all individual stations with a strength of 1,000 or over. It gives details for admissions from venereal diseases and for neuropsychiatric cases. As indicated below, the admissions shown for neuropsychiatric cases represent in effect the total admissions, that is admissions by transfer as well as direct admissions.

On pages 33 and 34 there are presented charts showing the morbidity trends for specified diseases during 1942 and 1943. On pages 36 to 69 appear the data for individual stations while on page 35 is the summary for the United States as a whole and for the Service Commands. On pages 70 and 71 the six stations with the highest rates of admission during the four week period ending, 27 November 1943 are shown for the various morbidity categories.

In reading the detailed tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During the four week period ending 27 November 1943, the admission rates from all causes and from all diseases combined rose slightly from the very low level which had prevailed during October 1943. This rise reflected a somewhat late but very sharp increase in admissions from colds, influenza, etc., which set in the latter part of November. The admission rates from all causes and from all diseases combined for November 1943 were about 7 percent lower than those for November 1942, chiefly because morbidity from respiratory causes was some 40 percent lower, despite the sharp increase in admissions towards the end of the month. The admission rate from injury decreased for the fourth consecutive month to the relatively low level of 77 per year per thousand strength, the lowest rate since January 1943.

In contrast with October, the admission rates for November 1943 from all causes and from all diseases combined varied considerably as between the several Service Commands. The First Service Command had the lowest rates, about 20 percent below those for the continental United States as a whole, while the Sixth Service Command had the highest rates, about 30 percent higher than the total United States rate. The Second, Fourth, Eighth, and Ninth Service Commands all had injury admission rates of about 80 per year per thousand so that the rate for the total United States was also quite close to this level since these four Service Commands make up over 70 percent of the total strength; the other Service Commands had slightly lower rates, with only the Military District of Washington being markedly lower.

RESPIRATORY DISEASES

The admission rate from colds, influenza, etc. for the four weeks ending 27 November 1943 rose to more than 150 per year per thousand strength in contrast with the level of slightly less than 100 per thousand which had prevailed since June. Even for the week ending 27 November 1943 the admission rate from colds, influenza, etc. was below the rate for the corresponding period in 1942. The outbreak of influenza which began to manifest itself at the end of November is only slightly reflected in the rate for November, but will obviously have considerable effect on the December rate. All Service Commands except the Eighth showed sizeable increases in the morbidity from colds, influenza, etc. The highest rate recorded was in the Sixth Service Command where morbidity more than tripled as compared with October.

Morbidity from pneumonia (including atypical) was somewhat higher in November than in October, although the relative increase in the rate (about 15 percent) was considerably less than that for colds, influenza, etc. In November the highest morbidity from pneumonia was experienced in the Sixth and Seventh Service Commands which showed rates of about 20 per thousand, or almost double the rate

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

for the United States as a whole; in contrast the Eighth and Ninth Service Commands had the lowest rates of less than 8 per thousand. As in recent months atypical pneumonia has continued to represent almost one-half of the total pneumonia cases in the United States. This proportion however has varied considerably by Service Command; thus in the First and Sixth Service Commands atypical pneumonia has accounted for about 60 percent of all cases and in the Military District of Washington for about 75 percent of the cases; in the Third, Seventh, and Eighth Service Commands the proportion has been only about 30 percent.

DIARRHEA AND DYSENTERY

Morbidity from diarrhea and dysentery continued to show the normal seasonal decline, being reported in November at less than 9 per thousand strength for the United States as a whole, which was a decline of about 10 percent from October. Morbidity from this cause was highest in the First, Second, and Seventh Service Commands, all of which had rates of about 13 per thousand as a result of several minor outbreaks, mostly among college and university training units.

VENEREAL DISEASES

The admission rate from all venereal diseases combined, excluding EPTI cases, remained at the same level in November as it had been in October but somewhat higher than during the early part of 1943. As in previous months, gonorrhea made up the great majority (about 75 percent) of the total morbidity from venereal diseases. The First Service Command and the Military District of Washington had morbidity from venereal disease excluding EPTI about 35 percent below that for the United States as a whole, while the Second Service Command, as in previous months, had the highest rate.

The morbidity represented by venereal EPTI cases was reported in November at 28 per year per thousand strength, the highest rate recorded so far, and is attributable to the increasingly larger number of selectees with venereal diseases coming up for induction. The highest morbidity due to venereal EPTI cases occurs in the Second, Fifth, and Sixth Service Commands. The variations in morbidity rates for venereal EPTI cases by Service Command have little significance because they reflect in part different geographical distribution of the Army relative to that of selectees, different proportions of white and colored inductees, different venereal disease treatment facilities, and varying administrative practices.

The morbidity from all venereal diseases combined, including EPTI cases, has shown a continuous upward trend since the beginning of 1943, reaching a new high of 54 per thousand strength in November as a result of the increase in EPTI cases.

NEUROPSYCHIATRIC DISORDERS

The reported rate of total admissions from neuropsychiatric disorders decreased somewhat from the level prevailing in the previous three months but was still well above the rates prevailing prior to July. The decline from October was principally attributable to a lower rate of admission for open ward cases.

It should be noted that the reported rate of total admissions from neuropsychiatric disorders overstates the actual morbidity from these causes to the extent that cases admitted to a station hospital and then transferred to a general hospital (or in some instances to another station hospital) are in many instances counted twice. The rate of total admissions from neuropsychiatric disorders for the country as a whole excluding general hospitals was only 25 per year per thousand strength in contrast with a rate of 42 per thousand when general hospitals are included. Because of the unequal distribution of general hospitals as between Service Commands, the variations in the rate of total admissions by Service Command are not very significant.

Beginning in December, general hospitals have been instructed to report neuropsychiatric cases so as to make possible the exclusion of cases transferred in computing the morbidity rate from these causes. It is believed that with such revised reporting it will be possible to present a proper measure of morbidity from neuropsychiatric disorders for the month of December and to recompute the data for past months. The revised Form 86ab which is to be put into effect in the near future provides for the separate reporting of neuropsychiatric admissions as between direct admissions and transfers.

MEASLES, MUMPS, AND SCARLET FEVER

The admission rates for these causes have continued on the relatively low levels expected in November. More than half of the cases of measles were in the Fourth Service Command, of which about 35 percent were at Fort Benning, Ga. The morbidity rate for scarlet fever in November, although low as compared with the peak experienced in the winter and spring months, was double that for

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

October, with most Service Commands showing significant increases.

MENINGITIS

In November the morbidity from this cause was at the relatively low level of .3 per thousand strength, the same as in the preceding two months and well below the epidemic levels reached in the early part of this year.

RHEUMATIC FEVER

Morbidity from rheumatic fever in November continued on about the same level as in September and October, which was considerably lower than in the spring months of this year. Nevertheless, the morbidity is relatively high in contrast with that experienced during most of 1942. If the Seventh Service Command is excluded, the admission rate for the remainder of the country is only .4 per thousand, or about the same as the 1942 level. As in October, about half of the cases reported were in the Seventh Service Command and of these about 40 percent were at Fort F. E. Warren, Wyo.

TUBERCULOSIS

Morbidity from this cause decreased slightly in November to equal that for July 1943, being the lowest rate reported during the past two years.

MALARIA

Morbidity from malaria acquired in the United States showed the expected seasonal decline, with the rate for November being only .1 per year per thousand strength. On the other hand, malaria presumably acquired outside of the United States showed an admission rate of 2.0 per thousand, the highest yet recorded. Whereas malaria acquired in the United States is chiefly concentrated in the Fourth, Eighth and Ninth Service Commands, that acquired overseas is fairly uniformly distributed as between the various Service Commands.

MORTALITY

The mortality rate from all causes was reported at slightly over 2 per thousand during November, which was somewhat lower than the rate for the preceding six month period. A decrease during November in the mortality rate from injury (which accounts for approximately 80 percent of the mortality rate from all causes) was responsible for this change. The mortality from disease registered the low rate of .47 per thousand strength or about the same as during the two preceding months; the death rate from disease of less than half a death per thousand prevailing during the past three months is definitely the lowest ever attained. All service commands showed low mortality from disease, but the Military District of Washington had the relatively high rate of 2.5 per thousand strength due chiefly to its older age constitution.

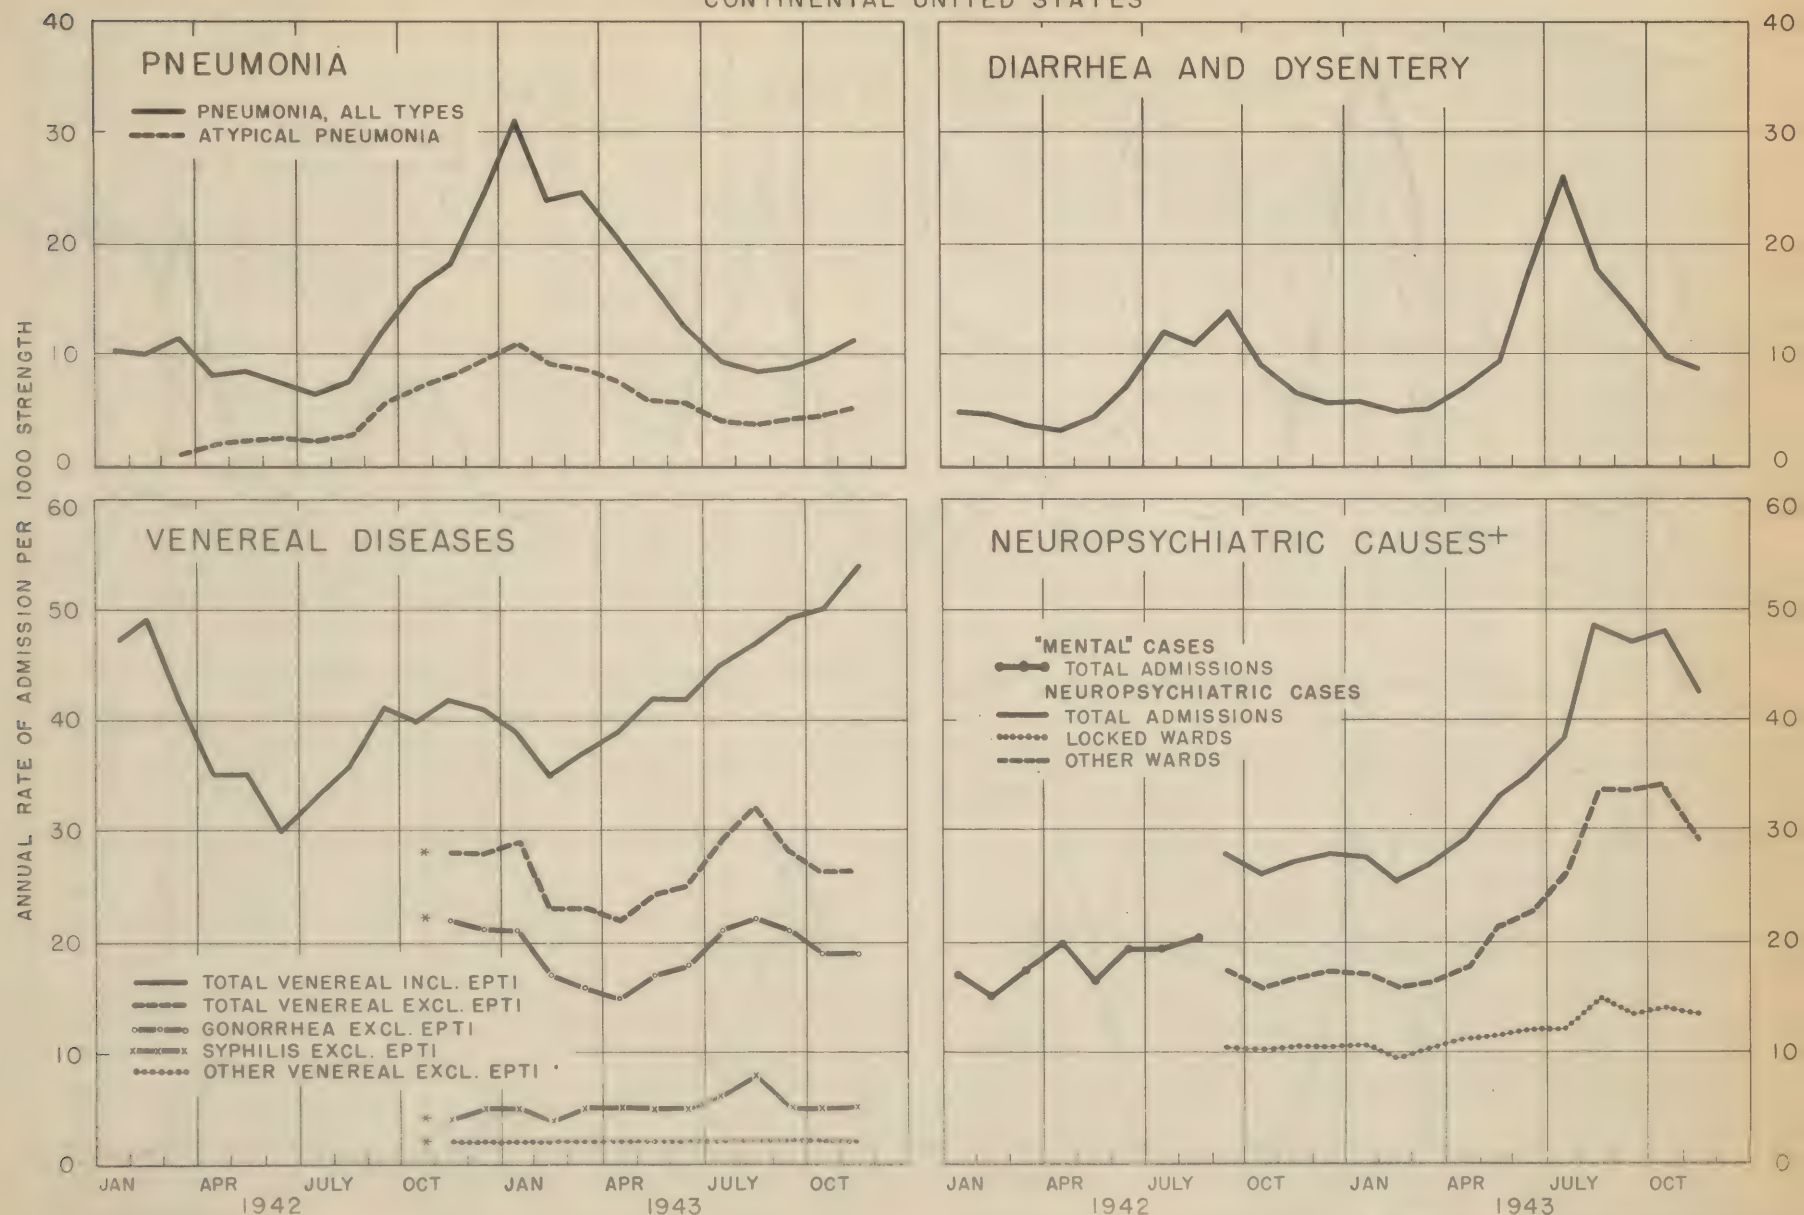

STATIONS WITH HIGHEST MORBIDITY

A number of smaller stations with strength under 5,000 showed rather high morbidity rates in November. Among these were Arlington, Calif. (high on all causes because of venereal EPTI), Los Angeles City College, Calif. (high on all causes, all diseases combined, colds, influenza, etc., and injury), Presidio of Monterey, Calif. (high on all causes because of venereal EPTI), and Fort Douglas, Utah (high on all causes because of venereal EPTI, colds, influenza, etc., and scarlet fever).

Very high rates of admission for mumps in Camp Abbot, Ore., for scarlet fever in Fort Douglas, Utah, for rheumatic fever in Ft. F.E. Warren, Wyo., for syphilis and "other" venereal diseases at Ft. Clark, Texas, and for gonorrhea at Hensley Field, Texas were registered in November as well as in October. In November Hampton Roads Port of Embarkation, Va. reported the extremely high rate of admissions of 200 per year per thousand from syphilis.
